

Rocker Stops

## Section 16 – Rocker Stops

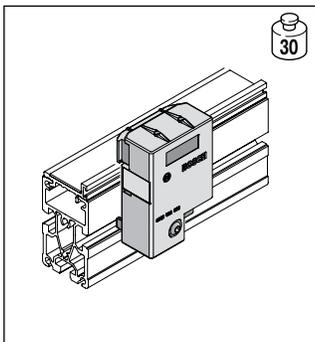

Rocker stops are used for area monitoring, workpiece pallet detection and as a stop when transporting a pallet transversely to an adjacent conveyor line.

When using a lift transfer unit a rocker also serves as a stop for the workpiece pallet and together with a proximity switch, signals the presence of the pallet.

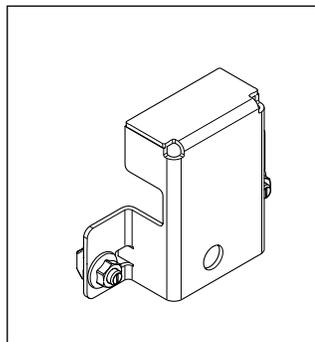

Area monitoring is accomplished with the rocker stop bar and a proximity switch. As long as the pallet is in contact with the rocker bar, the proximity switch detects the presence of the pallet. The area monitored will be the length of the rocker stop bar.

All rocker stops are shipped with the necessary mounting hardware and proximity switch mounting brackets. Proximity switches must be ordered separately on page 17-6.

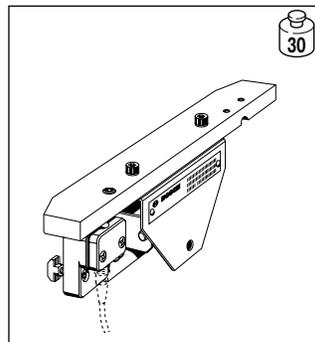

Fitting a rocker stop with a second proximity switch allows monitoring of the area and, the position of a workpiece pallet can be detected. As an example, this would be a requirement if using a rocker stop in conjunction with a reversible lift transfer unit.

Rocker Stops

# Rocker Stop

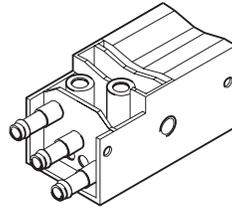

Model WI/M

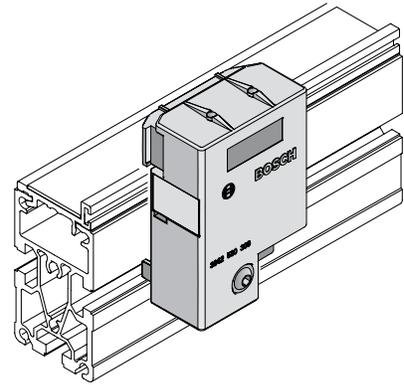

The WI/M mini rocker stop provides an economical method of workpiece pallet detection and can be used (in conjunction with other components) to create an accumulation control kit.

When used for pallet detection, a 12 mm body proximity switch is required (ordered separately on pg. 17-6). The switch is activated when a workpiece pallet passes in front of the rocker. In this configuration, the WI/M has a monitoring area of 44 mm.

The WI/M can also be combined with an optional Pneumatic Cylinder Switch. In this configuration, the actuation, which is caused by a pallet passing by a WI/M, is converted into a pneumatic signal. A pneumatic accumulation control kit is created by combining a WI/M with pneumatic cylinder switch and a VE2 stop gate.

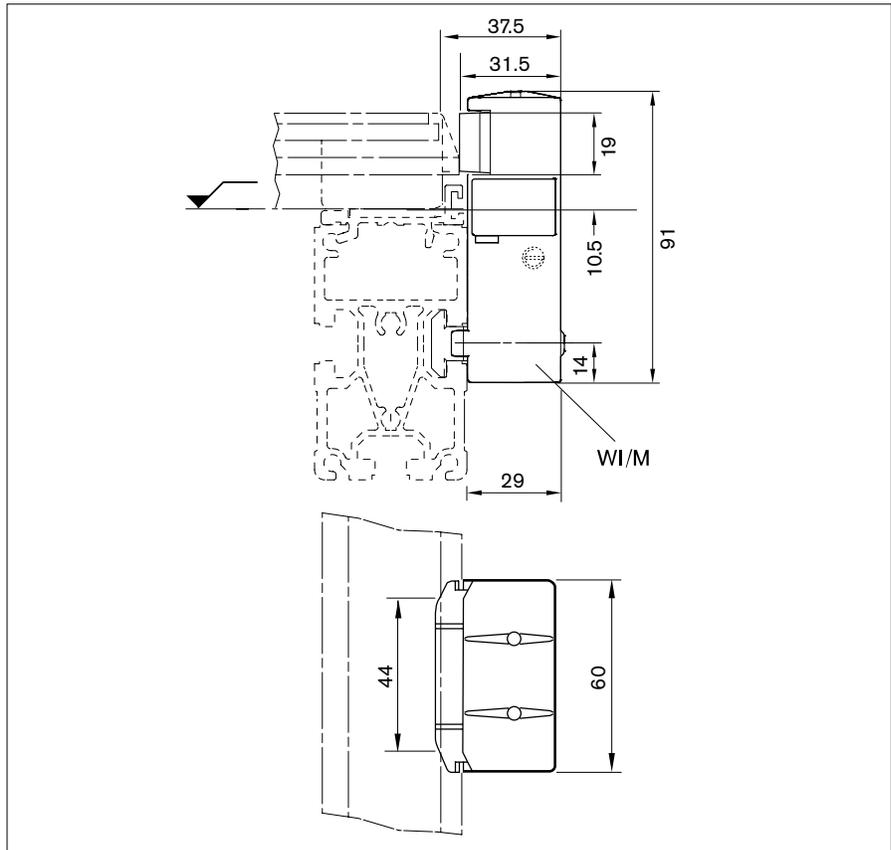

Pneumatic Cylinder Switch

Rocker Stops

# WI/M Protective Cover

Model WI/M

WI/M protective covers are designed to be used with WI/M mini rocker stops. Made of corrosion-resistant sheet steel, they provide a protective enclosure to help prevent damage to the rocker stop in harsh industrial environments.

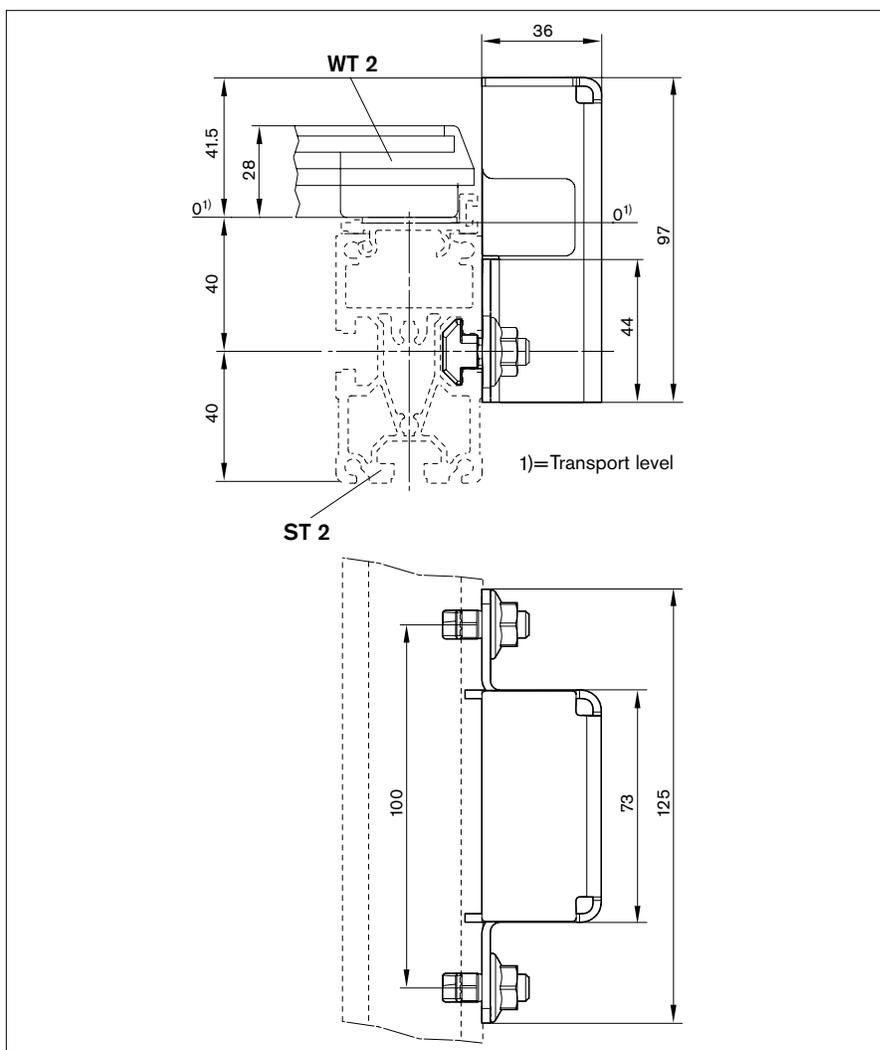

The protective cover attaches to the T-slot in the conveyor side rail and includes all required mounting hardware. Order rocker stops separately.

Rocker Stops

# Rocker Stop

Model WI2 ( $B_Q \leq 480$  mm)

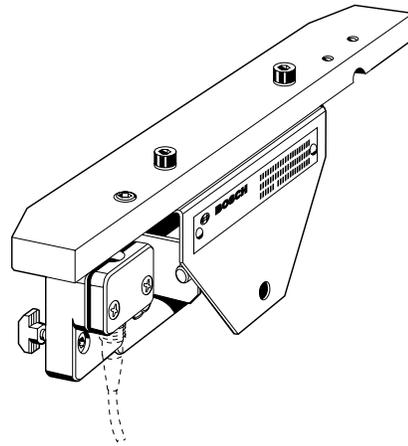

The WI2 rocker stop is used for area monitoring, workpiece pallet detection, and as a stop for transverse transfer of pallets. This model is used for pallet lengths of 480 mm and under. For total pallet and payload weights exceeding 30 kg, cushioned rockers WI2/D are recommended.

The stop rail protrudes slightly into the transport path, and when a workpiece pallet makes contact with the stop rail it pushes the rail outward, deactivating a proximity switch (not included, see pg. 17-6). The length of the area monitored depends on the length of the stop rail.

If the WI2 rocker stop is fitted with a second proximity switch, the position of the workpiece pallet can also be recognized. This is necessary if rockers are used together with reversible lift transverse units EQ2.

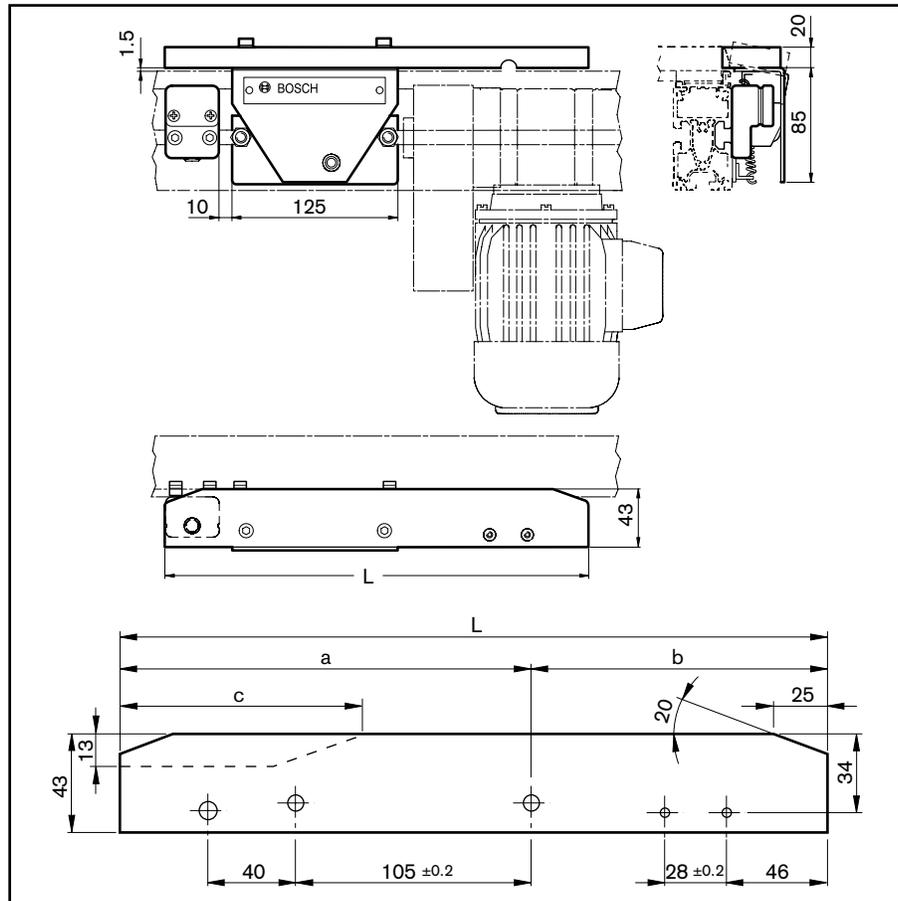

The WI2 rocker stop is only for use with total pallet & payload weights of 30 kg or less. The unit is shipped with an unmounted stop rail, necessary fastening hardware, switch brackets. Proximity switches must be ordered separately.

Rocker Stops

# Rocker Stop

Model WI2 ( $B_Q \geq 640$  mm)

The WI2 rocker stop is used for area monitoring, workpiece pallet detection, and as a stop for transverse transfer of pallets. This model is used for pallet lengths of 640 mm or greater. The WI2 rocker stop is only for use with total pallet & payload weights of 30 kg or less. For total pallet and payload weights exceeding 30 kg, cushioned rockers WI2/D are recommended.

The stop rail protrudes slightly into the transport path, and when a workpiece pallet makes contact with the stop rail it pushes the rail outward, Deactivating the a proximity switch (not included, see pg. 17-6). The length of the area monitored depends on the length of the stop rail.

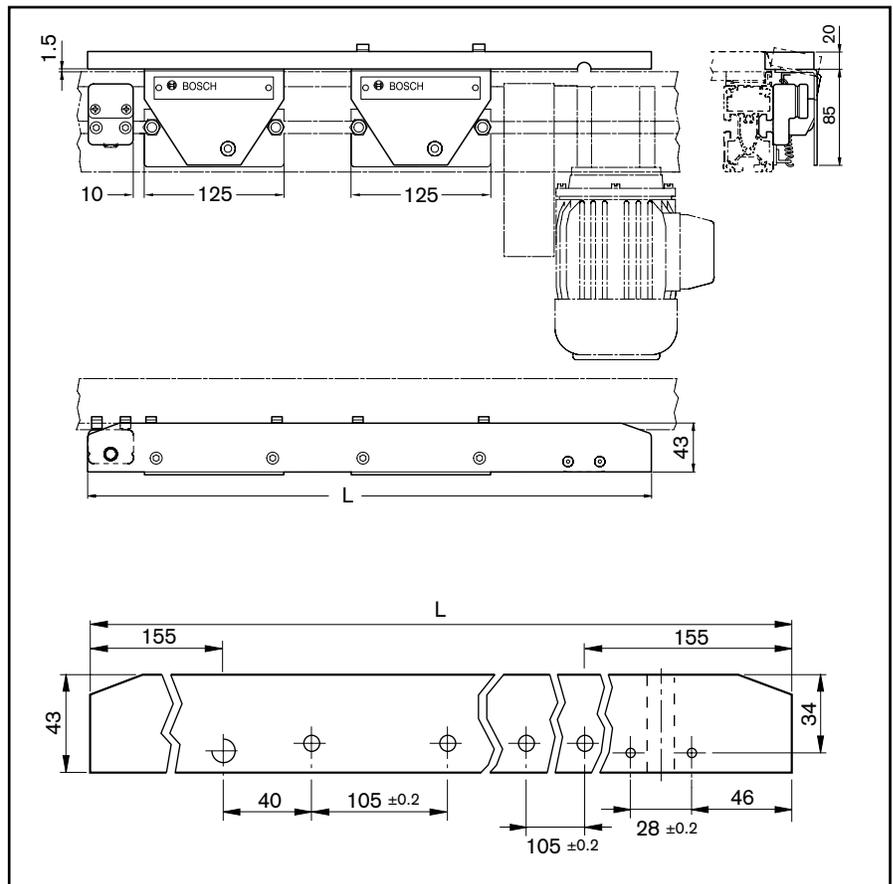

If the WI2 rocker stop is fitted with a second proximity switch, the position of the workpiece pallet can also be recognized. This is necessary if rockers are used together with reversible lift transverse units EQ2.

The unit is shipped with an unmounted stop rail, necessary fastening hardware, switch brackets. Proximity switches must be ordered separately.

Rocker Stops

# Cushioned Rocker Stop Kit

The cushioned rocker stop kit is used as an economical means of softly stopping pallets traveling along a transverse conveyor section.

The cushioned rocker stop kit combines two standard WI/M rockers (see page 16-2) with a VE2/DA10 (for pallet loads up to 10 kg) or a VE2/DA30 (for pallet loads from 10 - 30 kg). See page 15-6 for more information about VE2/DA10 and VE2/DA30 stop gates.

**NOTE:** All components must be ordered separately.

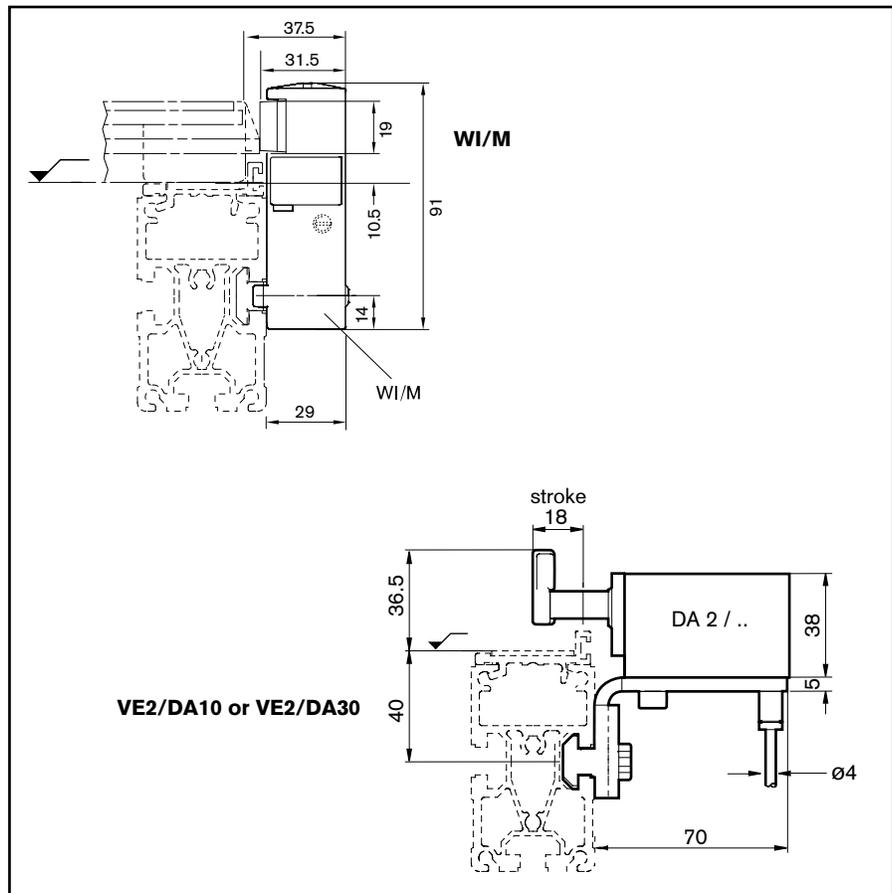

The VE2/DA10 or VE2/DA30 stops the pallet gradually, minimizing impact on the workpiece, before allowing it to contact the WI/M rocker. The damping effect is pneumatic, and the degree of damping is adjustable. Two WI/M modules must be used.

The WI/M cushioned rocker stop is only for use with total pallet & payload weights of 30 kg or less. The unit is shipped with necessary fastening hardware, and proximity switches must be ordered separately.

Rocker Stops

# Heavy Duty Rocker Stop

Model WI2/H

The WI2/H rocker stop is used for area monitoring, workpiece pallet detection, and as a stop for transfer of pallets. This model is used for pallet payloads of 30 kg or greater. For a cushioned stop of this capacity, the WI2/D cushioned rocker stop can be used.

The stop rail protrudes slightly into the transport path, and when a workpiece pallet makes contact with the stop rail it pushes the rail outward, activating a proximity switch (not included, see pg. 17-6).

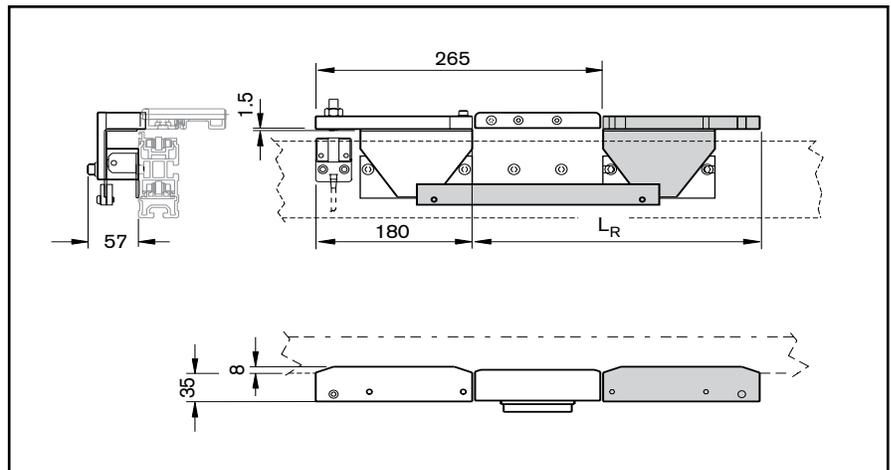

The WI2/H rocker stop can be fitted with a second rocker bar and proximity switch by using the second rocker extension kit. This kit consists of a second rocker and an extension bar (see illustration). This method allows the position of the workpiece pallet to be recognized along the entire length of the rocker.

The unit is shipped with necessary fastening hardware and switch brackets. Proximity switches must be ordered separately.

Rocker Stops

# Heavy Duty Cushioned Rocker Stop

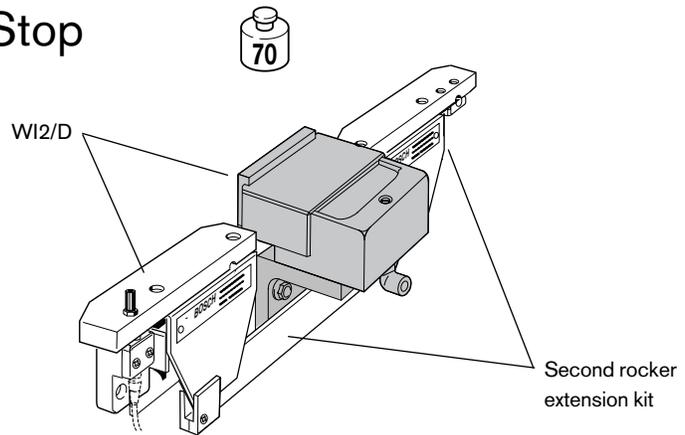

## Model WI2/D

The WI2/D cushioned rocker stop is used for area monitoring, workpiece pallet detection, and as a cushioned stop for transfer of pallets. This model is used for pallet payloads of 30 kg or greater.

The stop rail protrudes slightly into the transport path, and when a workpiece pallet makes contact with the stop rail it pushes the rail outward, activating a proximity switch (not included, see pg. 17-6).

The WI2/D cushioned rocker stop can be fitted with a second rocker bar and proximity switch by using the second rocker extension kit. This kit consists of a second rocker and an extension bar (see illustration). This method allows the position of the workpiece pallet to be recognized along the entire length of the rocker.

The unit is shipped with necessary fastening hardware and switch brackets. Proximity switches must be ordered separately.
